

Permanent Cosmetic Makeup

Intradermal Pigmentation

Intradermal Pigmentation is a revolutionary method of applying micro insertions of natural pigments into the dermal layer of the skin. This state of the art technique is medically proven and specifically designed to be completely safe. Intradermal Pigmentation is used for a variety of permanent cosmetic enhancements such as permanent eyebrows, eye liner and lip liner/color. Other permanent cosmetic procedures include vitiligo, stretch mark, and scar camouflage, areola restoration, hairline enhancement and more.

- Stretch marks
- Birthmarks
- Vitiligo
- Areola Restoration
- Scar Camouflage
- Freckles / Age spots
- Lip Liner / Lip Color
- Eyeliner

Eyebrows

The Intradermal Pigmentation procedure for eyebrows can mimic the appearance of hair in the brow line. Anyone who desires more fullness of the brows will love the procedure and the time saved not applying makeup. Those who used to apply pencil can go swimming, play tennis or wipe their forehead without the embarrassment of losing their eyebrows. Alopecia sufferers are pleasantly surprised at how natural it looks.

Before

After

Eyeliner

A subtle, natural look, mimicking thousands of tiny eyelashes with the implantation of pigments in the lash line is popular with both male and female clients. Additional shadowing of color can be added for a soft natural liner or a more bold, definite line can be achieved. Ophthalmologists recommend Intradermal Cosmetic procedures for those who are allergic to conventional makeup and for those wearing contact lenses.

Before

After

Lip Liner / Color

The Intradermal Pigmentation procedure for lip color is beautiful. It can appear to change the size and shape of the lips as well as the color. This procedure helps prevent lipstick from bleeding in the surrounding skin. A soft pink, similar to the lip color of a newborn baby, is popular for those wanting a natural look. A more dramatic color can be achieved if desired.

Frequently Asked Questions

Who benefits from Intradermal Cosmetics?

- Men as well as women.
- Busy people with little time to apply makeup.
- People with allergies to conventional makeup.
- Anyone who desires freedom and convenience from daily makeup application
- Those who are physically incapable of applying makeup.
- Athletic people and those with oily skin who tend to shed makeup easily.
- Burn survivors and people with flaws in their skin.
- Men and women who seek correction of asymmetrical facial features.
- Entertainers, actresses, and models - such as Elizabeth Taylor, Dolly Parton, Raquel Welch, Cher and others.
- Men and women who wish to look like their best all the time.

Is the procedure painful?

Topical anesthetics are used to minimize discomfort.

Do I have a choice of colors?

Definitely! There is a wide spectrum of colors that you may choose from.

Do I have a choice in the placement of pigments?

Of course. You will be fully aware during the procedure, instructing the technician where you wish the implants to be located.

What is involved in recovery?

There will be slight swelling and redness in the skin, which will subside quickly. You may resume normal activities immediately after the procedure. Complete healing takes one to six weeks while the pigmentation matures and reaches its final color.

This brochure is intended as an introduction to Intradermal Pigmentation. When considering this procedure, you should feel comfortable asking your technician for any additional information you may need. Intradermal Cosmetic technicians are certified in the specialty of Intradermal Pigmentation and are dedicated to the highest standards of patient welfare, implement sterilization, and procedure excellence.
